

Why is Salesforce mandating Multifactor Authentication (MFA)

Last Modified on 28/01/2025 2:14 pm GMT

Multifactor authentication adds an extra layer of protection to your Synaptic Pathways org.

Passwords alone no longer provide sufficient safeguards against unauthorized access to you and your client's data. This is why Salesforce requires MFA when accessing the software.

How does Multifactor Authentication work?

Multifactor Authentication requires users to confirm their identity using two or more forms of verification, known as factors, during login. One factor is something the user knows, such as their username and password. The other factors involve a security key or an authentication app. While passwords can be vulnerable to compromise, it's highly unlikely that an attacker would also have access to a strong verification method.

Salesforce provides the Salesforce Authenticator mobile app. After downloading the app, simply log in with your username and password, and the app will send you a push notification for approval.

For more information on MFA and some frequently asked questions, see [here](#).
